

National Functional Evaluation

Medicare 2017 Guidelines

MACRA: “Medicare Access & CHIP Reauthorization Act”: It replaces the three old Medicare reporting programs.

- 1- **Medicare meaningful use** →→→ Replaced by **Advanced care information**.
- 2- **PQRS** →→→ Replaced by **Quality**.
- 3- **Value based modifier** →→→ Replaced by **Cost**.

MIPS: Merit incentive based payment system: It is a performance-based payment adjustment system focused on evidence based and specific quality data practices.

- **Program started on January 1st 2017.**
- **Failure to participate and report:** 4% fee schedule penalty in 2018 and 2019.
- **Successful participation and reporting:** + 5% in 2019 with a 9% potential in 2022. The more you report the higher the incentive.

Quality:

- It replaces PQRS.
- Single practitioners: required to report 6 quality measures including a minimum of one outcome assessment measure.
- Group practitioner: required to report 15 measures.

Functional Evaluation testing: provide the necessary information and data to report.

7 outcome measures and 6 process measures

- **All high priority measures.**
- **Eligible patients:** Aged 18 years or older who receives treatment for functional deficits.
- **Rational:** If the treatment is designed to improve the functional deficits, it is logical to assess functional status using a standardized, **objective** tool to determine if the treatment improved the functional status of the patient over the treatment episode.
- **Clinical recommendation:** Functional status measures should be used to assist in the **planning, implementing and modification** of treatment interventions and should be used as measure of outcome.
- ❖ **Process Measures:** Evidence-Based practices that represent health system measures to systematize its improvement effort.

Measure	Measure number	Reported via
1-Functional outcome assessment	182	G8942: Baseline G8539: Positive G8542: Negative
2-Pain assessment and follow up	131	G8730: Positive G8731: Negative
3-Osteoarthritis, functional and pain assessment	109	1006F
4-Rheumatoid arthritis function status assessment	178	1170F
5-Functional status assessment for total hip replacement	376	EHR reporting "PROMISE-Global HOOS"
6-Functional status assessment for total knee replacement	375	HER reporting "PROMISE Global KOOS"

- ❖ **Outcome Measures:** High level clinical outcome measurements. A critical part of testing and implementing changes. Measures tell a team whether the changes they are making led to improvement.

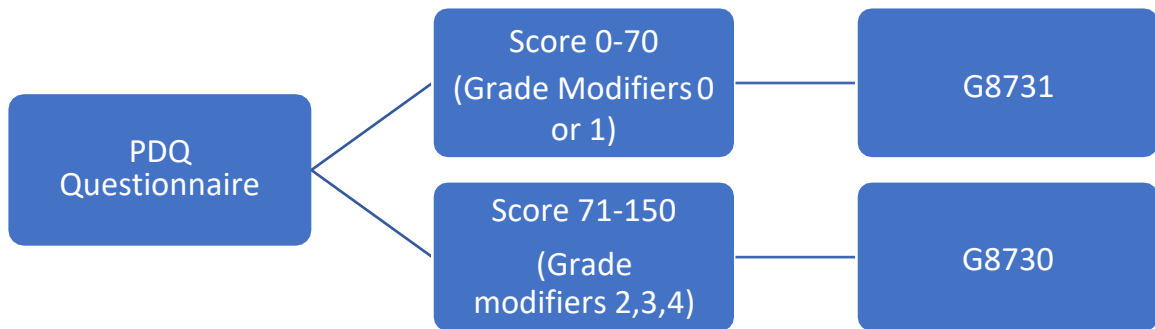

Functional status changes for patients with impairments.

7 measures based on the body part.

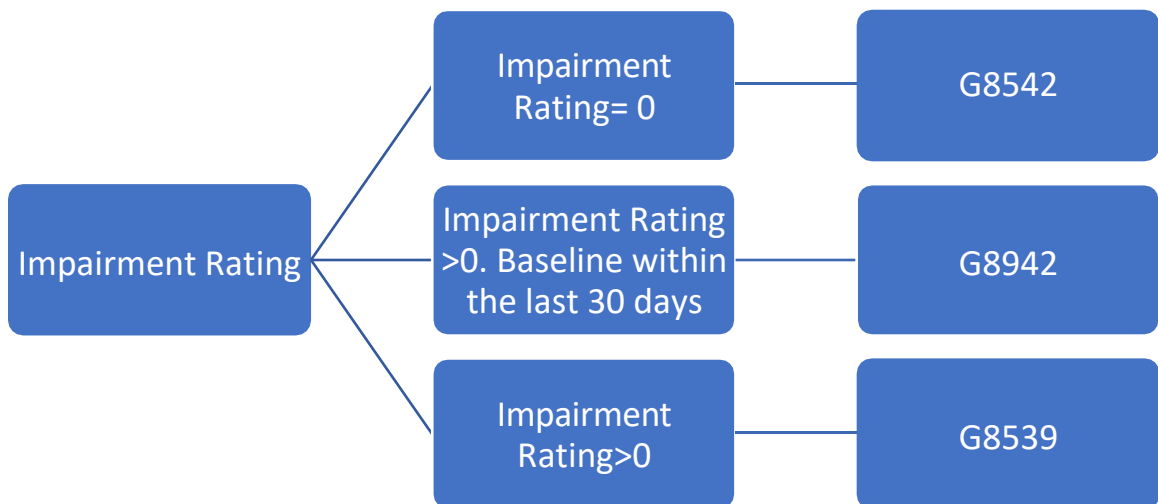

Measure	Measure number	Reported via
1-Functional Status changes for patients with General Orthopedic Impairments: (Mostly Cervical & Thoracic regions for this measure)	223	G8671: Negative G8672: Positive
2-Functional Status changes for patients with Elbow, Wrist Or Hand Impairments.	222	G8667: Negative G8688: Positive
3-Functional Status changes for patients with Shoulder Impairments.	221	G8663: Negative G8664: Positive
4-Functional Status changes for patients with Lumbar Spine Impairments.	425	G8659: Negative G8660: Positive
5-Functional Status changes for patients with Knee Impairments.	217	G8647: Negative G8648: Positive
6-Functional Status changes for patients with Hip Impairments.	218	G8651: Negative G8652: Positive
7-Functional Status changes for patients with Lower Leg, Foot or Ankle impairments.	219	G8655: Negative G8656: Positive

MIPS G codes Explanation:

1- Process Measure #131 “ Pain Assessment and Follow Up” based on the PDQ questionnaire:

2- Process Measure #182 “ Functional Assessment” based on the Impairment rating:

3- Outcome Measures #217, #218, #219, #220, #221, #222, #223,

“Functional Status Change”

Based on the Impairment rating change between 1st impairment calculation and last impairment calculation in the reporting period:

(A) Patient Functional Status Score=
100-baseline impairment rating

(B) Patient Functional Status Change Score=
(100- Follow up impairment)
- (100- baseline impairment)

(C) Predicted Functional Status Change Score=
(100-30% expected improvement impairment)-
(100-baseline impairment)

(D) Risk Adjusted Functional Status Change Residual Score=
B-C

If D less than 0 →
Cervical: G8672
Lumbar: G8660

If D equal to or greater than 0 →
Cervical: G8671
Lumbar: G8659

Example 1:

Patient baseline impairment 40%

Patient follow up impairment 20%

Then

$$A = 100 - 40 = 60$$

$$B = (100 - 20) - (100 - 40) = 20$$

30% expected improved impairment = 30% of 40 = 12, so expected Impairment is 28%

$$C = (100 - 28) - (100 - 40) = 12$$

$$D = 20 - 12 = 8 \geq 0 \rightarrow \text{Cervical G8671 or Lumbar G8659}$$

Example 2:

Patient baseline impairment 40%

Patient follow up impairment 30%

Then

$$A = 100 - 40 = 60$$

$$B = (100 - 30) - (100 - 40) = 10$$

30% expected improved impairment = 30% of 40 = 12, so expected Impairment is 28%

$$C = (100 - 28) - (100 - 40) = 12$$

$$D = 10 - 12 = -2 < 0 \rightarrow \text{Cervical G8672 or Lumbar G8660}$$
